

# Quarterly operations review, Q3 2026

## Availability

The registry met its availability target in July and September, and missed it in August because of INC-2093, the 42-minute outage during a database failover. The target is 99.9% for every month.

| Month     | Availability | Target | Incidents    |
|-----------|--------------|--------|--------------|
| July      | 99.97%       | 99.9%  | 0            |
| August    | 99.84%       | 99.9%  | 1 (INC-2093) |
| September | 99.95%       | 99.9%  | 0            |

## Latency

Median and p95 response times held steady for most agents. `research_agent`'s p95 rose in June when `kb-search` served stale cached results quickly, then returned to normal once the cache was fixed; the figures below are for Q3 only. `billing_agent`'s p95 stays the highest because each invoice needs a `payments-gateway` call.

| Agent                       | p50   | p95   | Change from Q2 |
|-----------------------------|-------|-------|----------------|
| <code>support_agent</code>  | 1.9 s | 4.1 s | -0.3 s         |
| <code>triage_agent</code>   | 1.2 s | 2.8 s | 0.0 s          |
| <code>research_agent</code> | 2.6 s | 5.9 s | +0.4 s         |
| <code>billing_agent</code>  | 3.1 s | 7.2 s | -0.6 s         |

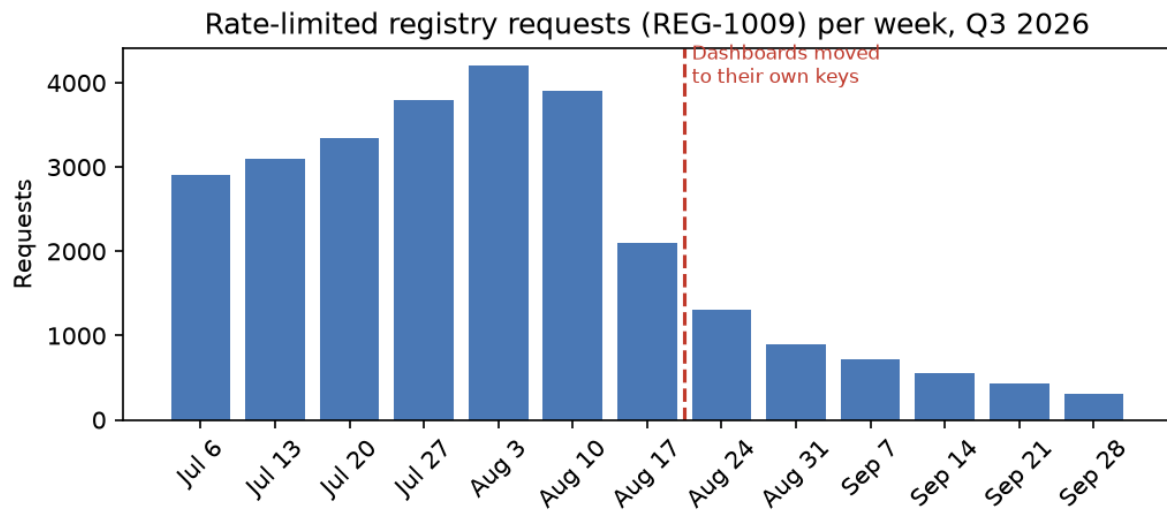

## Incidents

Two incidents affected the registry platform in Q3. INC-2067, from 15 to 22 June, overlapped the quarter's start only in its follow-up work: the `kb-search` cache review and dated search results were completed in July. INC-2093, on 27 August, took the registry down for 42 minutes during a database failover and is the only incident that counted against availability.

Follow-up actions from both incidents are complete. The standby lag alert added after INC-2093 has fired twice since, both times during planned maintenance, and was acknowledged within five minutes.

## Rate limiting

Rate-limited requests rose through July and early August, while several internal dashboards shared keys with agents. They fell after the dashboards moved to their own keys in mid-August.

## Cost

Model spend across all agents was within budget for the quarter. `billing_agent` stayed below its monthly cap in every month, and no cap raise was requested. The largest single change was `research_agent`'s lower spend after its migration planning moved test runs to a smaller model.
